WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or more, except for certain cases carded for record only (chiefly venereal disease cases which are treated on a duty status, and deaths which occurred before being "admitted" to hospital or quarters). Admissions designated as "injury" comprise all traumas (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications). Bearing in mind that under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties, all other cases are classified as "disease."

Admissions rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 25 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all

diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), total beds occupied and beds "available vacant."

Unless otherwise specified, normal bed capacity in this report is defined in Par. 36b (1) and (2) of AR40-1080, 10 December 1943, and Par. 14 WD Circular 43, 1 February 1944. This includes the T/O capacity of non-fixed hospitals but excludes convalescent facilities. Total beds include expansion beds in addition to normal beds. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in the tabulations for individual stations.

The number of beds "available vacant" is defined as 80% of the total capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. The bed capacity and beds occupied in convalescent facilities are also indicated. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

Because troops in transit and certain small detachments are not required to submit Reports, as well as for other reasons, the total strength of the reporting units as shown on this report has been consistently about four percent under the actual strength of the Army in the Continental United States.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 26 May 1944

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

As indicated in the chart on page 3, the admission rates from all causes, from disease and from injury all decreased. The admission rates from all causes and from disease thus resumed their seasonal downward trends which had been interrupted during the week ending 19 May 1944. For the week ending 26 May 1944, the admission rate from all causes was reported at 595 per year per thousand and the admission rate from disease at 527 per thousand; both these rates were the lowest thus far recorded this year, and were about 22 percent lower than for the corresponding week of 1943 and considerably under the lowest rates registered during the summer of either 1942 or 1943.

Morbidity from injury was reported at 68 per thousand or close to the low level which had prevailed during the first five months of 1944.

Respiratory Causes:

Admission rates from colds, influenza decreased for the fourteenth consecutive week, being currently reported at 104 per thousand or 12 percent below the rate for the preceding week and nearly 45 percent under the rate for the corresponding week of 1943. The current week's admission rate from these causes is comparable to that reported during the first week of November 1943, when morbidity from respiratory causes was almost at the low level experienced during the late summer and fall of 1943.

The admission rate from pneumonia declined to 10 per thousand or about 37 percent below the rate for the corresponding week of 1943.

Common Communicable Diseases:

Morbidity from venereal disease (excluding cases contracted prior to entry into active service) remained at 33 per thousand which is the highest rate reported so far this year. The number of new cases of measles, mumps, scarlet fever, meningitis and rheumatic fever all declined; the number of cases of measles, scarlet fever and meningitis reported for the current week was the lowest for any week this year. The number of cases of mumps and of rheumatic fever remained at a relatively high level as compared with the early weeks of the year.

VARIATIONS IN MORBIDITY BY SERVICE COMMAND

All Causes: Disease and Injury:

Slight increases in morbidity from all causes and from disease were registered in the First, Fifth and Ninth Service Commands; in the First Service Command the higher morbidity was in part due to a higher admissions for colds and influenza; in the Fifth Service Command to higher admissions from diarrhea and dysentery and venereal disease while in the Ninth Service Command higher admissions from venereal disease were a factor. The Second, Sixth and Seventh Service Commands reported markedly lower morbidity from all causes and disease in

NON-EFFECTIVE RATE

CONTINENTAL UNITED STATES

PATIENTS REMAINING UNDER TREATMENT

CONTINENTAL UNITED STATES

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 26 May 1944

COMMENT ON CURRENT TRENDS (CONT'D)

large part attributable to lower admission rates from respiratory causes.

The highest admission rates from all causes (717 per thousand) and from disease (671 per thousand) were again reported by the Military District of Washington. The First Service Command continued to experience the lowest morbidity from all causes (532 per thousand) and from disease (473 per thousand).

Respiratory Causes:

All Service Commands except the First reported lower morbidity from colds, influenza, etc. The largest decrease in morbidity from these causes were recorded by the Second, Sixth, and Seventh Service Commands. Notwithstanding this, the Seventh Service Command continued to report the highest admission rate from these causes (145 per thousand), while the lowest rate (80 per thousand) was again experienced in the Fourth Service Command.

Morbidity from pneumonia declined in every Service Command except the Fifth and Eighth. The Sixth Service Command continued to report the highest morbidity from this cause (21 per thousand).

Common Communicable Diseases:

Higher morbidity from venereal diseases (excluding EPTS cases) was reported from the Fifth, Seventh, and Ninth Service Commands. As a result the Fifth Service Command continued to report the highest morbidity from this cause (50 per thousand). Measles and meningitis cases declined sharply in the Fourth Service Command, while mumps and rheumatic fever cases decreased markedly in the Seventh Service Command.

NON-EFFECTIVE RATE:

The non-effective rate remained practically unchanged at 36.4 for the current week. It should be emphasized that despite lower morbidity experience the current level of the non-effective rate is higher than during the corresponding period of 1943 almost entirely because of the steadily increasing number of evacuees from overseas theaters. Because of the non-uniformity in the distribution of General Hospitals as between Service Commands, variations in the non-effective rates by Service Command have little significance.

HOSPITALIZATION DATA*

 †ALSO INCLUDES BEDS IN NON-FIXED HOSPITALS AT MANEUVER AREAS.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 26 MAY 1944

COMMENT ON CURRENT TRENDS (CONT'D)

PATIENTS REMAINING UNDER TREATMENT:

The total number of Army patients remaining in hospital at the end of the week continued at about 36 per thousand strength. Thus far in 1944 the number of neuropsychiatric cases remaining has fluctuated in the range from 15,300 to 17,000 and for the week ending 26 May 1944 was reported at 16,233 or slightly above the number for the previous week. The number of malaria cases under treatment has increased steadily in recent weeks from a low of 1,748 on 14 April to 2,143 on 26 May 1944; only 35 of these cases presumably were acquired in the United States. The number of tuberculosis cases remaining under treatment was reported at 1,126 as of 26 May 1944.

The net number of battle casualty patients admitted during the week was 792, the highest number recorded so far this year. This increase was accounted for chiefly by gross admissions by transfer numbering 781 at the five receiving and evacuation hospitals (the net admissions at these hospitals were only 437 because 344 such patients were disposed of by transfer during the week).

CURRENT HOSPITAL CONDITIONS:-

The total bed capacity as of 26 May 1944 was reported at about 368,000 or about 1,000 more than at the end of the previous week. The number of beds occupied was 143,500 or practically the same as for the previous week, while the number of "available vacant" beds increased to 151,700. Total beds occupied represented 39 percent of total bed capacity. There were 15 stations with bed capacity of about 7,500 having no "available vacant" beds; one General Hospital with a bed capacity of about 3,000 was included among them.

The number of normal beds was about 1,000 more than at the end of the previous week or about 281,000 or 76 percent of the total bed capacity. Included in the normal bed capacity on 26 May 1944 were 648 T/O hospital beds and tentage, while the total bed capacity included 728 such beds, of which 151 were occupied.

The total bed capacity of General Hospitals, which has shown a steady increase in recent months, was again reported at about 109,000 (the highest figure so far attained); about 48,500 of these beds (or 44 percent) were occupied. The "available vacant" beds at General Hospitals numbered 39,000 as of 26 May 1944. Normal beds at General Hospitals have been maintained at a level of about 85,000 since the beginning of the year.

The total bed capacity of Station Hospitals (including the relatively small number of T/O hospital beds and tentage mentioned above) continued at the 259,000 beds reported since 5 May 1944. Normal beds in these hospitals remained at about 196,000. Total beds occupied as of 26 May 1944 numbered 95,000 (or 37 percent of the corresponding total bed capacity) which is the lowest level reported during 1943 and 1944 to date. Station Hospitals had 113,000 "available vacant" beds as of 26 May 1944.

As of 26 May 1944 the bed capacity of convalescent facilities in General Hospitals numbered 14,155 beds of which 4,341 beds (or 31 percent) were occupied.
